2015

2026

1. Project Overview

The Global AI Adoption Dashboard is an interactive data visualization project created to present AI adoption and usage information through a collection of charts, comparisons, filters, and a Tableau Story. The Tableau visualization was subsequently integrated into a Python Flask web application.

2. Dashboard Components

Visualization	Purpose
School AI Adoption Trend	Shows the school AI adoption measure across the available years.
Student AI Usage by Country	Compares average student AI usage across countries.
Internet Penetration vs AI Adoption	Compares internet penetration percentage with school AI adoption.

Visualization	Purpose
Urban vs Rural AI Usage	Provides a comparison of AI usage-related values across urban and rural categories.
Average Daily AI Usage	Shows average daily AI usage across the available months.
Most Popular AI Tools	Provides a country-wise view of the AI tools represented in the dashboard.
Student vs Teacher AI Usage	Compares AI usage-related values for students and teachers.
AI Usage by Region	Compares average student AI usage across geographical regions.

3. Interactive Filters

The dashboard provides interactive controls for Top AI Tool, Region, Country, and Year. These filters allow users to change the displayed view and explore the available data from different perspectives.

4. Technologies Used

Technology	Role
Tableau Public	Interactive dashboard and story visualization
Python	Application programming
Flask	Web application and routing
HTML / CSS	Frontend structure and styling
GitHub	Project storage and sharing

5. Flask Integration

The Flask application provides a simple homepage with two navigation options: View Dashboard and View Story. The Dashboard and Story pages embed the published Tableau Public views using the Tableau Embedding API. This keeps the original Tableau visualizations intact while making them accessible through one web application.

6. Project Structure

```
tableau-flask-app/  
■■■ README.md  
■■■ PROJECT_REPORT.md  
■■■ app.py  
■■■ requirements.txt  
■■■ templates/  
    ■■■ index.html  
    ■■■ dashboard.html  
    ■■■ story.html
```

7. How to Run

Install the required dependency using `pip install -r requirements.txt`, then start the application with `python app.py`. Open `http://127.0.0.1:5000` in a browser to access the application.

8. Conclusion

This project demonstrates the integration of interactive Tableau Public analytics with a Python Flask web application. The final application provides a simple entry point to both the Global AI Adoption Dashboard and Tableau Story, while GitHub provides a convenient way to store and share the complete project.
